IAM | LAB 1

Deprovisioning: The Access That Has to Disappear

Workday joiner, mover, leaver, and rehire testing. Removal tested at the hour it was promised.

What this proves: Real lifecycle testing from real Workday provisioning work, with negative cases given the same rigor as the success path.

Cordon Murphy | CompTIA Security+ | Workday provisioning, Flagstar Bank RBAC and SSO/MFA testing

Recreated from real Workday and Flagstar Bank work. No employer data. Entra ID and Okta work elsewhere in this portfolio is lab tenant only.

The problem

Provisioning gets attention because a new hire who cannot sign in is loud. Deprovisioning fails quietly. An account for someone who left in March still works in June, and nobody finds it until a review or an incident.

How I built it

1. Provisioned a test worker in Workday: hire event, worker ID, role assigned by job profile.
2. Mover case: transferred the worker and confirmed old role permissions removed the same day the new role was added.
3. Leaver case: terminated the worker and confirmed access ended on the termination date, not at end of week.
4. Rehire case: rehired the same person and confirmed the account started clean, with no old permissions resurrected.
5. Negative cases: terminated user sign in attempt, transferred user attempting an old role action, approver approving their own record.
6. Wrote every case with data state first: worker status, effective date, role set before and after.

Validation, expected vs actual

ID	Case	Expected result
IAM1-01	New hire provisions on start date	Access active on the start date, not before
IAM1-02	Transfer removes old role same day	Old role action blocked after transfer
IAM1-03	Termination ends access on date	Sign in blocked on the termination date
IAM1-04	Rehire starts clean	No prior permissions restored
IAM1-05	Approver approves own record	Blocked, separation of duties holds

Timing is tested, not just the end state. Removal is checked at hour one, because a removal that lands on day two still leaves a day of access nobody approved.

The finding

The mover case is where access accumulates in most systems. Addition is instant and visible. Removal is scheduled, batched, or manual, and that gap is the finding even when a test passes later. Access reviews go better when removal was tested before anyone had to certify it.

Deliverables in this lab

- 14 lifecycle test cases: joiner, mover, leaver, rehire
- Role before and after table for each transition
- Timing check: when removal takes effect vs when it should

Skills shown: IAM, Workday, provisioning and deprovisioning, RBAC, access governance, least privilege, Security+, testing
